Experiment On The Existence Of God

On 2024.09.30 I silently asked God to prove His existence to me. Following this, I decided to conduct an experiment for this purpose. I have dice with 8 faces, numbered 1 to 8. I decided to roll a die on the floor without looking at the result but threw it in front of my cat, as I believe that God can see through the eyes of living beings. Then, I picked an identical die to choose a number that would match the number on the die I had thrown, trusting that God could telepathically transmit ideas through thoughts and thus help me choose a number from the second die.

After rolling the die in front of the cat without looking, I picked up the second die and chose the number 7. Then, I looked at the die on the floor and saw that it showed 2. However, the idea occurred to me to check the underside of the die, which displayed the number 7.

Of course, by choosing an additional number after the first, the probability of matching numbers increased. I decided to repeat the experiment. The exact same result occurred. This time, the die showed 8, I chose 1, and on the underside of the number 8 was the number 1. I said out loud: "No way."

The probability of correctly guessing the number on an 8-sided die twice in a row is approximately 1.56%. Based on this experiment, I consider that God has proven His existence to me with a probability of 98.44%.

Starlike Meditation

This type of mediation only works when my mind is racing or I just don't feel well.

First I pray to God to enlighten my mind.

Next I lie on my back in bed in a relaxed position and close my eyes, keeping my hands on my stomach to feel my breath and also with my fingers in a prayer position to think about God.

And lastly I observe my thoughts without any interaction.

Whenever I practice Starlike Mediation powerful insights come to my mind sooner or later that help me overcome my bad state of mind.

Quantum Entanglement In Time

Somewhere in October 2023 I had a very interesting and inspiring lucid dream. In that lucid dream I meet two unidentified young and bright scientists. One of them told me he has information about the past and the other one about the future. I chose to learn about the future and the scientist I chose told me a substance in a room at the present moment is the same in the future as well.

After I woke up I realized this idea may refer to quantum entanglement. Basically entangled subatomic particles in the present could remain entangled forever if nothing changes. This is how the idea Quantum Entanglement In Time was born.

The idea is very simple as follows. Humans could entangle subatomic particles in a way that can convey messages if they are disentangled partially. We know quantum entanglement is independent of distance as it acts instantly across any space. How about testing if quantum entanglement is independent of time as well? Basically entangling multiple pairs of particles that disentangled would convey the message yes and entangling multiple pairs of particles that disentangled would convey the message no. The more yes and no particle pairs are entangled the less odds for a random message if some of these particles are disentangled. And further on humans can just wait to see if humans from the future disentangle just the pairs responsible for yes or just the pairs responsible for no.

Quantum Entanglement in Time

Starlike Universe

Somewhere at the end of May 2024 I researched with ChatGPT if there is any way for humans to create matter out of energy. I know humans are able to create energy out of matter since the discovery of fire but vice versa there is no practical way for the moment. The first realization that occurred to me while performing this research was that the Universe tends to convert matter to energy and not the other way around or both. Months later the next realization that occurred to me is there could be a way for humans far into the future to create a new Universe and this is how the idea Starlike Universe appeared.

The idea is very simple as follows. It appears the vacuum of space contains a form of energy that creates matter and antimatter particle pairs that quickly annihilate each other after they appear. Starlike Universe idea implies in the future humans could gather matter and antimatter particles by preventing their annihilation to aim for a controlled annihilation once enough matter and antimatter is collected. This idea is actually inspired by the Big Bang Theory as scientists agree this Universe started by the annihilation of an immense quantity of matter with a slightly less quantity of antimatter. The Starlike Universe idea implies collecting equal quantities of matter and antimatter by using undiscovered types of energy to prevent the natural annihilation that occurs in the vacuum of space. And in the process the unidentified types of energy used to prevent natural annihilation would be produced by annihilating controllably a part of collected antimatter with matter outside the collection process (matter already existing in the Universe).

Starlike Universe

energetic force
fields

matter
confined by
force fields

anti matter
confined by
force fields

* a part of resulting antimatter is used to annihilate with matter outside the process to generate the energy used for the process.

Starlike Teleportation

I had another scientific idea this time during a period when I did not feel well. I was frustrated for years by the apparent impossibility of humans performing FTL (faster than light space travel). This is how the idea that I decided to call Starlike Teleportation was born.

This idea is also very simple as follows. This time I will make a wild assumption which is that matter and antimatter annihilation produces maximum amounts of energy in the smallest amount of space thus the resulting energy can consume the vacuum of space proportionally with the quantity of matter and antimatter annihilated. If this assumption holds true then a starship could actually create a space tunnel by annihilating large amounts of matter and antimatter and use this tunnel to travel large amounts of cosmic space outside the tunnel.
